Coventry Log Homes
c/o Richard Titorenko:

Recently you called and asked about our energy usage on our new Coventry Log Home, the No-Change Clearwater model. We are very pleased with our new log home and, based on the additional upgrades we added during construction, we very happy with the low energy usage here to date.

As you may recall several additional upgrades that we added to our home include: spray foam insulation on all interior exposed walls and ceiling areas followed with fiberglass insulation to meet or exceed local building code requirements; Superior Walls pre-formed and insulated basement foundation; ground-source heat pump and all energy efficient appliances. Note: We installed a high-efficiency ground-source heat pump, manufactured by WaterFurnace, which also contributes to the low energy usage.

In the past ten months of energy usage since our home was constructed our total energy usage is \$652.38 or \$65.24 for a monthly average. In addition, our log home is completely electric which means that all heating, cooling and appliance usage is from the one single source of energy: electric.

My wife and I are completely satisfied with our new log home and the low energy costs realized by the additional energy saving upgrades.

Please feel free to contact us if you have any further questions.

Sincerely,

Stephen & Carol
